                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              disorders and to develop other prods.

Disclosure; Page 37-39; 59pp; English.

Gene sequences for 3 complement regulatory proteins encoded within the genome of herpesvirus Saimiri (HVS) are disclosed, i.e. membrane complement control protein homolog (mCCPH) (Q66956), secreted complement control protein homolog (seCPH) (Q66957) and HVS-15 (Q66958). mCCPH and sCCPH share substantial homology with the human complement inhibitory proteins factor H, CD35, CD46, CD55 and C4bp, which inhibit C3 convertase activity in the complement cascade. The gene sequences and corresponding proteins (R55792-94) can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             N-PSDB; 066957.

New complement regulatory proteins of Herpes virus Saimiri - are used to inhibit complement-mediated lysis in treating immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             21-JUL-1994.

CC This protein sequence comprises the herpesvirus Saimiri membrane CC glycoprotein mcCPH, an inhibitor of complement inhibitor such as CCPH, and are thus protected from inactivation upon exposure to CC producer cell producing the vector particle; and (2) a chimeric CC producer cell producing the vector particle; and (2) a chimeric CC retroviral envelope protein (see also W26324) with at least part CC of the N-terminal receptor-binding domain removed and replaced by CC aprotein domain having a complement inhibitor activity. The CC prosence of a body fluid containing complement, preferably ex vivo, CC especially for gene therapy, e.g. of hereditary or acquired blood CC disorders by transduction of haematopoletic stem cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   used to inhibit complement mediated lysis in treating immune disorders and to develop other prods. Disclosure; Page 3-35; 59pp; English. Gene sequences for 3 complement regulatory proteins encoded within the genome of herpesvirus Saimiri (HVS) are disclosed, i.e. membrane complement control protein homolog (mCCPH) (066956), secreted complement control protein homolog (mCCPH) (066957) and HVS-15 (066958). mCCPH and SCCPH share substantial homology with the human complement inhibitory proteins factor H, CD35, CD46, CD55 and c4bp, which inhibit C3 convertase activity in the complement cascade. The gene sequences and corresponding proteins (R55792-94) can be used to control the complement arm of the immune system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            mCCPH; membrane complement control protein homolog; sCCPH; secreted complement control protein homolog; HVS-15; complement regulatory protein; complement inhibitory protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (ALEX-) ALEXION PHARM INC Albrecht J, Fleckenstein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    regulator of complement activation. Expression of CD46 in eukaryotic host cells, e.g. COS-7 and CHO-KL, is facilitated by lowering the A+T content of the short consensus repeat regions of the CD46 gene (see T17596-99) to give products (R93940-43) useful e.g. as immunomodulators. Modified CD46 may also be expressed on the organs of transgenic animals of use for organ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            transplantation
                                                                                                                                                                                     Claim 12; Page 36-37; 60pp; English.

CD46 subSCR3 (R93941) is the product of a cDNA construct
(R17597) obtd by splice overlap extension PCR of wild type CD46
(CDNA (T17595). The A+T content of AT-rich exon 5 of the CD46
gene, encoding the short consensus repeat 3 (SCR3) region of
CD46, is lowered. This results in improved prodn. in eukaryotic
host cells, e.g. CHO-K1 and COS-7. CD46 subSCR3 is used to prevent
complement or inflammation-mediated tissue damage, to improve
immunity to tumours or viruses, to control fertilisation and to
prevent spontaneous abortion. Expression in transgenic animals,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CD46; recombinant protein; short consensus repeat; regulator of complement activation; transgenic anim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           R93941;

                                                                                                                                                                                                                                                                                                                                                           B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Y Surfaces which prevent or reduce complement activation - having surface bound homologous complement restriction factor Example 1; Fig 1A; 50pp; English.

C The present sequence is human MCP, which was used in the development of a novel surface bound to a homologous complement crestriction factor (HCRF), where the surface is not a surface to which HCRF binds in vivo. The surface can be used in medical caparatus (e.g. extra-corporeal circulation systems, tubing, valves, membranes, pumps, oxygenators, catheters, cannulas, fluid creservoirs or prostheses), medical dressings, surgical equipment, can abnormality which prevents the complement spatient has commandly or from being properly regulated) and purification can be used to reduce or prevent activation of complement, and to sequence morbidity due to complement activation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         δõ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New recombinant mammalian membrane co-factor protein - for treating diseases with altered complement activity e.g. inflammatory and auto-immune conditions
Disclosure; fig 1, 38pp; English.
This human isoform of a membrane cofactor protein (MCP) is useful in a pharmaceutical compsn. for the treatment of inflammatory and autoimmune diseases mediated by excess or misdirection of complement activity e.g. rheumatoid arthritis or multiple sclerosis. Protection against tissue injury caused by e.g. myocardial infarction or stroke may also be provided. Antibodies raised farction or stroke may also be provided.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    against this MCP can be used in autoimmune disease diagnosis to predict the probability of recurrent miscarriages by testing for MCP levels in the placenta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 See also Q10865-66 and R10927.

Disclosure; Page 66-68; 85pp; English.

A terminal complement inhibitor protein (CIP), is used in the romatruction of chimeric cDNA coding for transmembrane terminal CIP, pref. comprising amino acids 1-77 of CD59 fused to amino acids 270-350 (the transmembrane domain) of CD46 (R86316). Such chimeric cDNA is incorporated into a retrovirus vector and used in the breeding of transgenic animals as a means of producing transgenic organs that are protected against human complement
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Terminal complement inhibitor protein; terminal CIP; CD59; CD46; transmembrane terminal CIP; TMTCIP; Ly6 antigen; transgenic animal; organ transplantation; glycosyl-phosphatidylinositol; GPI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (ALEX-) ALEXION PHARM INC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes drug compositions which contain as can active component a peptide which has specific affinity to particular cphospholipids (such as phosphatidyl ethanolamine or phosphatidyl serine). CC especially to phospholipids which constitute a lipid bilayer of cellular cortex and of which the concentration in the bilayer increases in cells which are abnormal (e.g. through injury, denaturation or activation). In CC which are abnormal (e.g. through injury, denaturation or activation). In CC particular, the peptide contains a sequence having phospholipid affinity CC and a structure of formula (I): (Al)a-(A2)b-(A3)c, where (Al) is one of two specific sequences (see W69516 and W69517) or MEVIGCEAQNIX (see CC TRYLRIHPOSWYHQIALR, LRYLRIHPOSWYHQIALR (see W69517) or MEVIGCEAQNIX (see CC W69518); a = 0-5; b = 1-5, and c = 0-5, preferred are the formulae CC W69518); a = 0-5; b = 1-5, and c = 0-5, preferred are the formulae CC M2-A2-A3, A2-A3, A2-A3, a2-A2-A3, and A2-A3 (especially A2-A3, A2-A3, accordance is linked to a peptide such as a blood factor, especially thrombo-modulin, urina-statin or membrane CC cofactor protein. The drugs are used for the treatment and prevention of CC diseases involving blood coagulation, inflammatory and immunological constraints. The present sequence represents a peptide from the present

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

NT Two codominant alleles of factor H are present in mice.
NT Factor H functions as a cofactor in the inactivation of C3b by serine proteinase I and also increases the rate of dissociation of the C3bbb complex (C3 convertase) and the (C3b)nBb complex (C5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ##molecule_type mRNA

Release 3.1A John F. Collins, Biocomputing Research Unit. Copyright (c) 1993-1998 University of Edinburgh, U.K. Distribution rights by Oxford Molecular Ltd protein - protein database search, using Smith-Waterman algorithm \*\*\*\*\*\*\*\*\*\*\*\*

Run on: MPsrch\_pp Thu Jun 8 21:41:59 2000; MasPar time 10.76 Seconds 750.375 Million cell updates/sec

Tabular output not generated.

Description: Perfect Score: >US-09-316-163-10 (1-255) from US09316163.pep 2025 1 EDCNELPPERNTEILTGSWS.....EKSCDNPYIPNGDYSPLRIK 265

Sequence:

Scoring table: PAM 150 Gap 11

Searched: 83857 segs, 30454973 residues

Database: Post-processing: Minimum Match 08 Lightng first 45 summaries wiss-prot38

Statistics: Mean 43.808; Variance 61.409; scale 0.713

pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
